

Phase 4 Project:

Movie Recommendation System

- Student Name : Brian O'Donnell
- Pace: Flex
- Scheduled Project Review Time: January 3rd, 20223 @ 10:00am
- Instructor Name: Abhineet Kulkarni

Overview

This project uses the data made available by the 'MovieLens' dataset, which contains 4 CSV files where information such as movie titles, ratings and users are stored. The goal of this project is to create a recommendation system for a new online movie streaming company. We will import the CSV files, inspect and clean the data, perform EDA and then build our models.

Business Understanding

Our stakeholder, "Nu-Stream", is a new start-up company who are attempting to build their own movie streaming service. I have been tasked with creating a recommendation system based off a collection of user movie reviews. Another aspect that will need to be addresses is how to recommend movies for a new user, something that is often called the 'cold-start' problem. I believe after the completion of the models our stakeholder will be able to properly suggest appropriate movies to their customers.

Data Understanding

The 'MovieLens' dataset is provided by the GroupLens research lab at the university of Minnesota. This is a well documented dataset that contains everything from movie titles and ID's, user ID's and ratings, and movie genres. It is a great asset to companies in our position and should have the information we need to build our models. The method we will be using to achieve our goals is known as User-Based Collaborative Filtering. In which the system predicst the movies that a user might like on the basis of ratings given to that movie by the other users who have similar taste with that of the target user,

To begin, we will start by importing the needed libraries and files that will be used in this project. ***

```
import csv
import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
import seaborn as sns
from collections import defaultdict
from surprise import Dataset
from surprise import Reader
from surprise import accuracy
from surprise.model_selection import train_test_split
```

```

from surprise.model_selection import cross_validate
from surprise.model_selection import GridSearchCV
from surprise.model_selection import KFold
from surprise import NormalPredictor
from surprise import NormalPredictor
from surprise import BaselineOnly
from surprise import KNNBasic
from surprise import KNNWithMeans
from surprise import KNNBaseline, KNNWithZScore
from surprise import SVD
from surprise import SVDpp
from surprise import NMF
from surprise import SlopeOne
from surprise import CoClustering

%matplotlib inline
movies =
pd.read_csv('/Users/natashawyatt/Documents/Flatiron_school/Phase_4/
Phase_4_Project/ml-latest-small/movies.csv')
ratings =
pd.read_csv('/Users/natashawyatt/Documents/Flatiron_school/Phase_4/
Phase_4_Project/ml-latest-small/ratings.csv')
links =
pd.read_csv('/Users/natashawyatt/Documents/Flatiron_school/Phase_4/
Phase_4_Project/ml-latest-small/links.csv')
tags =
pd.read_csv('/Users/natashawyatt/Documents/Flatiron_school/Phase_4/
Phase_4_Project/ml-latest-small/tags.csv')

```

The four files made available by MovieLens are:

- Movies.csv
- Ratings.csv
- Links.csv
- Tags.csv

We will take a look, one by one, to see what each contains and what is needed for our project. This will also lead to the cleaning phase of the project where we process the data to make it useable for our models.

Movies

A look at the first few rows of the movies file....
 movies.head()

	movieId		title \
0	1		Toy Story (1995)

```

1          2          Jumanji (1995)
2          3          Grumpier Old Men (1995)
3          4          Waiting to Exhale (1995)
4          5  Father of the Bride Part II (1995)

```

```

                                genres
0  Adventure|Animation|Children|Comedy|Fantasy
1                                Adventure|Children|Fantasy
2                                Comedy|Romance
3                                Comedy|Drama|Romance
4                                Comedy

```

```
movies.info()
```

```

<class 'pandas.core.frame.DataFrame'>
RangeIndex: 9742 entries, 0 to 9741
Data columns (total 3 columns):
 #   Column      Non-Null Count  Dtype
---  -
 0  movieId    9742 non-null   int64
 1  title      9742 non-null   object
 2  genres     9742 non-null   object
dtypes: int64(1), object(2)
memory usage: 228.5+ KB

```

We see the Movies file contains:

- movieId
- title
- genres

While all these columns are very important, we will most likely need some information from the other tables to get everything we need.

Ratings

A look at the ratings file...

```
ratings.head()
```

```

   userId  movieId  rating  timestamp
0        1         1     4.0  964982703
1        1         3     4.0  964981247
2        1         6     4.0  964982224
3        1        47     5.0  964983815
4        1        50     5.0  964982931

```

```
ratings.info()
```

```

<class 'pandas.core.frame.DataFrame'>
RangeIndex: 100836 entries, 0 to 100835

```

```
Data columns (total 4 columns):
#   Column      Non-Null Count  Dtype
---  -
0   userId      100836 non-null   int64
1   movieId      100836 non-null   int64
2   rating       100836 non-null   float64
3   timestamp    100836 non-null   int64
dtypes: float64(1), int64(3)
memory usage: 3.1 MB
```

Ratings file contains:

- userId
- movieId
- rating
- timestamp

This file not only has the movieId, but the userId and their ratings as well. This is definitely something needed for our models, but it does not have the movie title, and the timestamp column probably is not of much use.

Tags

A look at the tags file...

```
tags.head()

   userId  movieId      tag  timestamp
0        2    60756    funny  1445714994
1        2    60756  Highly quotable  1445714996
2        2    60756    will ferrell  1445714992
3        2    89774  Boxing story    1445715207
4        2    89774      MMA        1445715200
```

```
tags.info()
```

```
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 3683 entries, 0 to 3682
Data columns (total 4 columns):
#   Column      Non-Null Count  Dtype
---  -
0   userId      3683 non-null   int64
1   movieId      3683 non-null   int64
2   tag          3683 non-null   object
3   timestamp    3683 non-null   int64
dtypes: int64(3), object(1)
memory usage: 115.2+ KB
```

Tags file contains:

- userId
- movieId
- tag
- timestamp

The only thing this file offers that the others do not is the 'tag' which gives some characteristics of the movie, such as themes or actors.

Links

A look at the links file...

```
links.head()
```

	movieId	imdbId	tmdbId
0	1	114709	862.0
1	2	113497	8844.0
2	3	113228	15602.0
3	4	114885	31357.0
4	5	113041	11862.0

```
links.info()
```

```
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 9742 entries, 0 to 9741
Data columns (total 3 columns):
#   Column      Non-Null Count  Dtype
---  -
0   movieId     9742 non-null   int64
1   imdbId      9742 non-null   int64
2   tmdbId      9734 non-null   float64
dtypes: float64(1), int64(2)
memory usage: 228.5 KB
```

The links file contains:

- movieId
- imdbId
- tmdbId

So this file has the corresponding ID's for movies across MovieId, IMDB and TheMoviesDB. This File will most likely not be used.

Cleaning

We now have a general idea of what the data looks like, we will start by doing a few simple cleaning steps, dropping the 'timestamp' column which has no use for us, and giving the movie year its own column.

```
# removing timestamp column from both ratings and tags as it does not help us
```

```
ratings.drop(columns='timestamp', inplace=True)
```

```
tags.drop(columns='timestamp', inplace=True)
```

Year

Now we will create a year column all to its self, and the next few cells will be dedicated to examining this information and seeing if it can be useful to us.

We will follow this process for the majority of columns in our tables.

```
# We will give year its own column...
```

```
movies['Year'] = movies['title'].str.extract('.*\((.*)\)'.*, expand = False)
```

```
movies.head()
```

	movieId	title \
0	1	Toy Story (1995)
1	2	Jumanji (1995)
2	3	Grumpier Old Men (1995)
3	4	Waiting to Exhale (1995)
4	5	Father of the Bride Part II (1995)

	genres	Year
0	Adventure Animation Children Comedy Fantasy	1995
1	Adventure Children Fantasy	1995
2	Comedy Romance	1995
3	Comedy Drama Romance	1995
4	Comedy	1995

```
# Now that we have the year in its own column, lets make sure it looks right.
```

```
movies['Year'].unique()
```

```
array(['1995', '1994', '1996', '1976', '1992', '1967', '1993', '1964',  
      '1977', '1965', '1982', '1990', '1991', '1989', '1937', '1940',  
      '1969', '1981', '1973', '1970', '1955', '1959', '1968', '1988',  
      '1997', '1972', '1943', '1952', '1951', '1957', '1961', '1958',  
      '1954', '1934', '1944', '1960', '1963', '1942', '1941', '1953',  
      '1939', '1950', '1946', '1945', '1938', '1947', '1935', '1936',  
      '1956', '1949', '1932', '1975', '1974', '1971', '1979', '1987',  
      '1986', '1980', '1978', '1985', '1966', '1962', '1983', '1984',  
      '1948', '1933', '1931', '1922', '1998', '1929', '1930', '1927',  
      '1928', '1999', '2000', '1926', '1919', '1921', '1925', '1923',  
      '2001', '2002', '2003', '1920', '1915', '1924', '2004', '1916',  
      '1917', '2005', '2006', '1902', nan, '1903', '2007', '2008',  
      '2009', '2010', '2011', '2012', '2013', '2014', '2015', '2016',  
      '2017', '2018', '1908', '2006-2007'], dtype=object)
```

```
# Check what movie this is that has a range, then we will just set the correct year
```

```
movies[movies['Year'] == "2006–2007"]
```

	movieId		title
genres \			
9518	171749	Death Note: Desu nôto (2006–2007)	(no genres listed)

	Year
9518	2006–2007

```
#After IMDB search it appears to be released in 2007
```

```
movies['Year'] = movies['Year'].replace("2006–2007", "2007")
```

Another important cleaning step is to make sure there are no missing values, or Nan, which stands for 'Not a number'. We will check the year column for these and how we address the them depends on just how many Nan's there are.

```
movies[pd.isna(movies['Year'])]
```

	movieId		title	\
6059	40697		Babylon 5	
9031	140956		Ready Player One	
9091	143410		Hyena Road	
9138	147250	The Adventures of Sherlock Holmes and Doctor W...		
9179	149334		Nocturnal Animals	
9259	156605		Paterson	
9367	162414		Moonlight	
9448	167570		The OA	
9514	171495		Cosmos	
9515	171631	Maria Bamford: Old Baby		
9525	171891		Generation Iron 2	
9611	176601		Black Mirror	

	genres	Year
6059	Sci-Fi	NaN
9031	Action Sci-Fi Thriller	NaN
9091	(no genres listed)	NaN
9138	(no genres listed)	NaN
9179	Drama Thriller	NaN
9259	(no genres listed)	NaN
9367	Drama	NaN
9448	(no genres listed)	NaN
9514	(no genres listed)	NaN
9515	(no genres listed)	NaN

```
9525      (no genres listed)  NaN
9611      (no genres listed)  NaN
```

These will just be dropped since there are so few of them...

```
movies = movies.dropna(subset=['Year'],how='any')
```

```
movies['Year'].describe()
```

```
count      9730
unique       106
top         2002
freq        311
Name: Year, dtype: object
```

```
movies['Year'].value_counts()
```

```
2002      311
2006      295
2001      294
2007      285
2000      283
```

```
...
1922       1
1917       1
1902       1
1921       1
1908       1
```

```
Name: Year, Length: 106, dtype: int64
```

Looking at the year column to see the distribution..

```
year_count = movies.groupby('Year').count()['title'].reset_index()
year_count.head(10)
```

	Year	title
0	1902	1
1	1903	1
2	1908	1
3	1915	1
4	1916	4
5	1917	1
6	1919	1
7	1920	2
8	1921	1
9	1922	1

```
movies['Year'].describe()
```

```
count      9730
unique       106
top         2002
freq        311
Name: Year, dtype: object
```

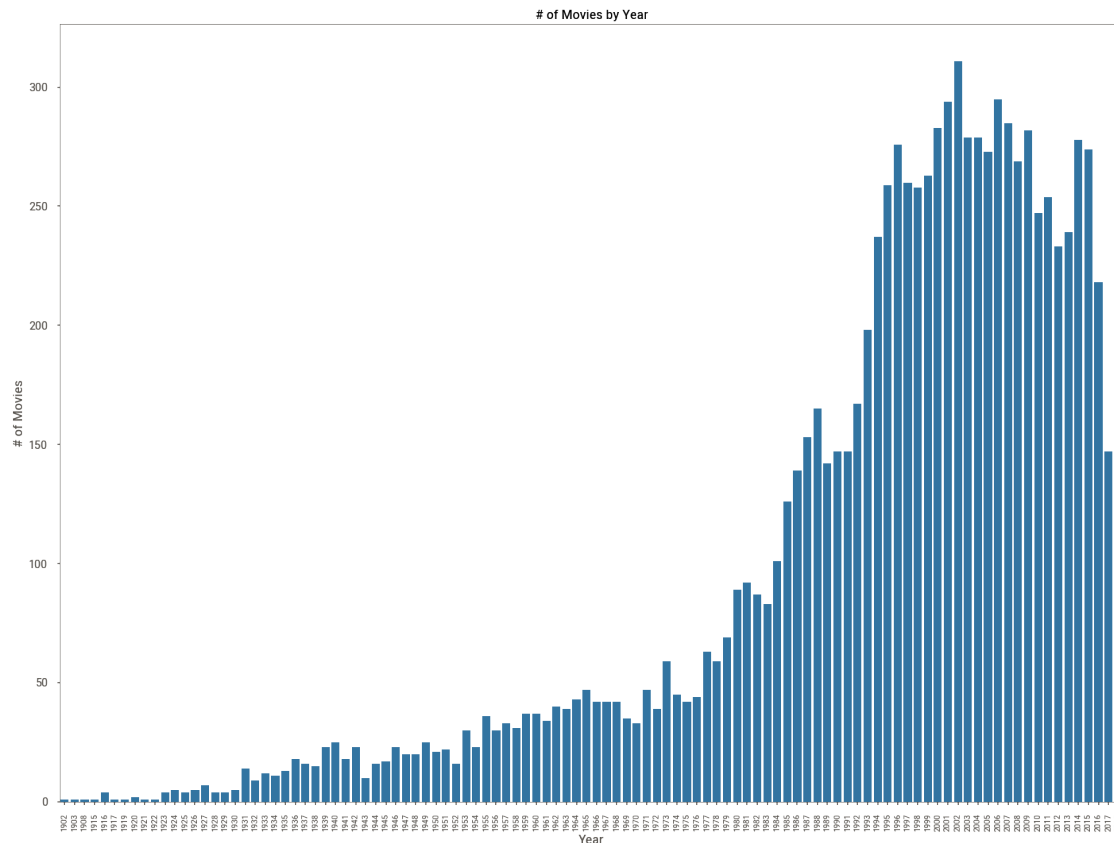

```
year_count.describe()
```

	title
count	106.000000
mean	91.792453
std	102.245709
min	1.000000
25%	16.000000
50%	39.500000
75%	151.500000
max	311.000000

```
#plot the years - lineplot
```

```
with plt.style.context('seaborn-poster'):
    fig, ax = plt.subplots(figsize=(24,18))
    sns.barplot(x='Year',
                y = 'title',
                data=year_count,
                color='tab:blue');

    plt.xlabel("Year", fontsize=16)
    plt.ylabel("# of Movies", fontsize=16)
    plt.title("# of Movies by Year",fontsize=16)
    plt.xticks(fontsize=10, rotation=90)
    plt.yticks(fontsize=14)
    ax.grid(False)
    plt.show()
    plt.savefig('years_plot.png')
```

<Figure size 921.6x633.6 with 0 Axes>

Year Findings

After some minor cleaning our 'Year' column looks useable. We see that there are a total of 106 different years in which a movie was released inside this dataframe, beginning with 1902 ending sometime in 2018. By the steep drop off we can assume it is somewhat early 2018 that they stopped adding movies, so it may not be completely up to date with current trends.

Before moving onto the next column there is another issue that we will address now.

Similar to Nan's, something else that needs to be addressed in order to make clean models is duplicates, which we will check for now...

```
# Check for duplicates in movieId
print((not movies["movieId"].is_unique))
# Check for duplicates in title
print((not movies["title"].is_unique))
```

False
True

```
movies[movies.duplicated(["title"], keep=False)]
```

	movieId		title \
650	838		Emma (1996)
2141	2851		Saturn 3 (1980)
4169	6003	Confessions of a Dangerous	Mind (2002)
5601	26958		Emma (1996)
5854	32600		Eros (2004)
5931	34048		War of the Worlds (2005)
6932	64997		War of the Worlds (2005)
9106	144606	Confessions of a Dangerous	Mind (2002)
9135	147002		Eros (2004)
9468	168358		Saturn 3 (1980)

	genres	Year
650	Comedy Drama Romance	1996
2141	Adventure Sci-Fi Thriller	1980
4169	Comedy Crime Drama Thriller	2002
5601	Romance	1996
5854	Drama	2004
5931	Action Adventure Sci-Fi Thriller	2005
6932	Action Sci-Fi	2005
9106	Comedy Crime Drama Romance Thriller	2002
9135	Drama Romance	2004
9468	Sci-Fi Thriller	1980

So after staring at this for a few minutes I see that there are 5 movies that are duplicates:

- Emma
- Saturn 3
- Confessions of a Dangerour Mind
- Eros
- War of the Worlds Obviously the titles are the same, but different movieId, we will replace one Id with the other for each duplicate, and then make sure it changes across all the files.

```
movie_id_change = {838:26958, 2851:168358,
6003:144606,32600:147002,34048:64997}
movies['movieId'].replace(movie_id_change,inplace=True)
movies = movies.drop_duplicates(subset=["movieId","title"])
```

```
ratings['movieId'].replace(movie_id_change,inplace=True)
tags['movieId'].replace(movie_id_change,inplace=True)
links['movieId'].replace(movie_id_change,inplace=True)
```

Validation check

```
print('Is there a duplicate value in a column movieId? Ans:',not
movies["movieId"].is_unique)
print('Is there a duplicate value in a column title? Ans:',not
movies["title"].is_unique)
```

Is there a duplicate value in a column movieId? Ans: False
Is there a duplicate value in a column title? Ans: False

Genres

The genre column needs some work, we will need to preprocess and separate the genres to be able to work with them. Also earlier I noticed a lot of missing values in the genre column, Ill attempt to fix that now.

```
movies['genres']

0      Adventure|Animation|Children|Comedy|Fantasy
1              Adventure|Children|Fantasy
2                  Comedy|Romance
3              Comedy|Drama|Romance
4                      Comedy
...
9737      Action|Animation|Comedy|Fantasy
9738      Animation|Comedy|Fantasy
9739                      Drama
9740      Action|Animation
9741                      Comedy
Name: genres, Length: 9725, dtype: object

movies['genres'] = movies['genres'].replace('(no genres listed)',
np.nan)
print('Number of missing values in genres
column:',movies['genres'].isna().sum())

Number of missing values in genres column: 26

movies = movies.dropna(subset=['genres'],how='any')
movies = movies.reset_index(drop=True)

print('Number of missing values in genres
column:',movies['genres'].isna().sum())

Number of missing values in genres column: 0
```

So the 26 missing genres has been addressed, we will now use the process of One-Hot-Encoding to create a binary column for each genre.

Next we will:

- Visualize the genres
- Extract the genres and encode them using binary to be able to use them in models.

```
import pandas as pd
```

```

# Extract the genre information for each movie
genres = [genre.split('|') for genre in movies['genres']]

# Create a dictionary that maps each genre to a count of the number of
# movies in that genre
genre_counts = {}
for genre_list in genres:
    for genre in genre_list:
        if genre in genre_counts:
            genre_counts[genre] += 1
        else:
            genre_counts[genre] = 1

# Sort the genres by their count, in descending order
sorted_genres = sorted(genre_counts.items(), key=lambda x: x[1],
reverse=True)

#Print the genres and their counts
for genre, count in sorted_genres:
    print(f'{genre}: {count} movies')

```

```

Drama: 4357 movies
Comedy: 3755 movies
Thriller: 1890 movies
Action: 1826 movies
Romance: 1593 movies
Adventure: 1263 movies
Crime: 1198 movies
Horror: 978 movies
Sci-Fi: 976 movies
Fantasy: 779 movies
Children: 664 movies
Animation: 611 movies
Mystery: 573 movies
Documentary: 440 movies
War: 382 movies
Musical: 334 movies
Western: 167 movies
IMAX: 158 movies
Film-Noir: 87 movies

```

```

len(genres)
for x in genres:
    movies[x] = 0
for i in range(len(movies.genres)):
    for x in movies.genres[i].split('|'):
        movies[x][i]=1

```

#dropping the genres column as it's a no longer required

Ratings

We will now try to find out what each movies average rating is and more importantly, how many ratings each movie has. If a movie has only 2 reviews but they are both 5 stars then that could create an imbalance in the model output, we want to make sure the movies have a minimum amount of ratings.

#Finding out the average rating per movie and more importantly how many ratings they have...

```
avg_rating =  
ratings.groupby('movieId').rating.mean().rename('avg_rating')  
num_rating =  
ratings.groupby('movieId').userId.count().rename('num_rating')  
print(avg_rating.head())  
print(num_rating.head())
```

```

```
plt.show()
```

The majority of reviews look like they fall on the top half of the 0.5-5 rating spectrum. More specifically between 3.0-4.0. ***

Creating DataFrames

Now that we have looked into our files, seen the dataframes and cleaned them to our satisfaction we will begin creating some final datasets. These will be at our disposal for user-item matrices for our models.

Finally time to merge tables now that it looks like most obstacles have been cleaned up.

```
movies = pd.merge(movies, avg_rating, how='left', on='movieId')
movies = pd.merge(movies, num_rating, how='left', on='movieId')
# Also filling in any Nan's with a Zero rating or Zero votes, again helps with modeling
movies['avg_rating'].fillna(0, inplace=True)
movies['num_rating'].fillna(0, inplace=True)
```

```
/opt/anaconda3/envs/learn-env/lib/python3.8/site-packages/pandas/
core/series.py:4517: SettingWithCopyWarning:
A value is trying to be set on a copy of a slice from a DataFrame
```

See the caveats in the documentation:

https://pandas.pydata.org/pandas-docs/stable/user_guide/indexing.html#returning-a-view-versus-a-copy

```
    return super().fillna(
```

```
movies.info()
```

```
<class 'pandas.core.frame.DataFrame'>
Int64Index: 9699 entries, 0 to 9698
Data columns (total 24 columns):
 #   Column          Non-Null Count  Dtype
---  -
```

```

0    movieId      9699 non-null    int64
1    title        9699 non-null    object
2    year         9699 non-null    object
3    Adventure    9699 non-null    int64

23   num_rating   9699 non-null    float64
dtypes: float64(2), int64(20), object(2)
memory usage: 1.8+ MB

```

Final Dataframes..

We merged one dataframe after our cleaning and added some new features, and in the next few cells I will create some more. Not all of these tables will be used but I am trying to create different sets of 'User-Item' matrices that may be useful for our models.

```

# Another merge to get userId in there....
# This dataframe will have all the needed attributes, movies, users,
genres, reviews...

```

```

movie_and_ratings = pd.merge(ratings, movies, how='left', on =
'movieId')
movie_and_ratings.rename(columns={'rating_x': 'rating',
                                'rating_y': 'RatingsCount'},
                        inplace=True)

```

```

movie_and_ratings.info()

```

```

<class 'pandas.core.frame.DataFrame'>
Int64Index: 100836 entries, 0 to 100835
Data columns (total 26 columns):

Number of Reviews

So an issue we have to address is the fact that some movies may have a 5 star rating, but only have a handful of reviews. We want those movies to have less influence than movies with several reviews otherwise the model may create poor recommendations of movies that have few reviews.

Setting a minimum number of reviews

```
minimum_num_ratings = 100
```

```
movie_and_ratings=movie_and_ratings[movie_and_ratings['num_rating']>mi  
nimum_num_ratings].sort_values(by=['avg_rating'], ascending=False)
```

merging ratings and movies data

```
matrix_df = pd.merge(ratings, movies, how='left', on = 'movieId')
```

creating matrix

```
movie_user_matrix = matrix_df.pivot_table(index='userId',
```

```
columns='title', values='avg_rating')
movie_user_matrix
```

```
title      '71 (2014)  'Hellboy': The Seeds of Creation (2004)  \
userId
```

Collaborative Filtering with User-Item Matrix

These last tables represent our user-item matrices. This is used in our recommendation system to represent the interactions between users and items, where each row is a userId and each column is an item, which in our case is a movie.

The reason there are some Nan's is because obviously not every user has seen much less rated every movie.

First Models

To begin, in the context of the Surprise library, the 'build_full_trainset' function is used to create a Trainset object from a Dataset object. A Trainset object is a special type of dataset object that is used to train a recommendation model in the Surprise library. It contains the ratings data, as well as additional information such as the indices of the users and items, the rating scale, and the number of ratings. And from the Trainset we can create the Testset and therefore are able to train the model and make predictions in the user-item matrix.

```
# read in values as Surprise dataset
reader = Reader(rating_scale=(0,5))
data = Dataset.load_from_df(movie_and_ratings[['userId', 'title',
'rating']],
    reader)
```

```
#generating a trainset
trainset = data.build_full_trainset()
testset = trainset.build_anti_testset()
print('Number of users: ', dataset.n_users,)
print('Number of items: ', dataset.n_items)
print('Number of ratings: ', dataset.n_ratings)
```

```
Number of users: 610
Number of items: 2121
Number of ratings: 79640
```

SVD

Singular value decomposition (SVD) is a matrix factorization technique that can be used to decompose a matrix into its constituent parts. In the context of recommendation systems, SVD can be used to decompose a user-item matrix into the product of three matrices: a user matrix, a diagonal matrix of singular values, and an item matrix. These matrices can then be used to make recommendations to users.

```
#Instantiate the SVD model
svd = SVD()

# Returning 5 cross-validated iterations
cv_svd = cross_validate(SVD(), data, cv=5, n_jobs=5, verbose=True)
```

Evaluating RMSE, MAE of algorithm SVD on 5 split(s).

	Fold 1	Fold 2	Fold 3	Fold 4	Fold 5	Mean	Std
RMSE (testset)	0.8474	0.8441	0.8495	0.8491	0.8573	0.8495	
0.0044							
MAE (testset)	0.6495	0.6486	0.6511	0.6499	0.6568	0.6512	
0.0029							
Fit time	3.47	3.46	3.39	3.54	3.41	3.45	0.05
Test time	0.08	0.09	0.08	0.08	0.09	0.08	0.01

SVD Grid Search

We ran 5 iterations of the SVD algo and got decent returns for our metrics, at least to start with. We will now run a grid search in an attempt to find the best parameter for the SVD algorithm to get our error scores even lower while trying to avoid overfitting.

```
# From lesson *
# Perform a gridsearch with SVD
# ⚠ This cell may take several minutes to run
params = {'n_factors': [20, 50, 100],
          'n_epochs': [5, 10],
          'lr_all': [0.002, 0.005],
          'reg_all': [0.02, 0.1, 0.5]}
g_s_svd = GridSearchCV(SVD, param_grid=params, n_jobs=-1)
g_s_svd.fit(data)

# n_factors = latent/underlying factors-higher can improve but also overfit
# n_epochs = iterations, higher can learn more but also overfit

print(g_s_svd.best_score)
print(g_s_svd.best_params)

{'rmse': 0.8527852887315772, 'mae': 0.6549498875244633}
{'rmse': {'n_factors': 20, 'n_epochs': 10, 'lr_all': 0.005, 'reg_all': 0.02}, 'mae': {'n_factors': 20, 'n_epochs': 10, 'lr_all': 0.005, 'reg_all': 0.02}}
```

FINAL SVD MODEL

```
# This cell takes longer to run because the parameters are even more specific, but does yield lower errors..
#Parameter space
# run time approximately 10 min
svd_param_grid = {'n_epochs': [20, 25, 30, 40, 50],
                  'lr_all': [0.007, 0.009, 0.01, 0.02],
                  'reg_all': [0.02, 0.04, 0.1, 0.2]}

# This will take some time to execute.
gs_svd = GridSearchCV(SVD, svd_param_grid, measures=['rmse', 'mae'],
cv=5, n_jobs=5)
gs_svd.fit(data)

print('Best value for SVD -RMSE:', round(gs_svd.best_score['rmse'], 4), '; MAE:', round(gs_svd.best_score['mae'], 4))
print('Optimal params RMSE =', gs_svd.best_params['rmse'])
print('optimal params MAE =', gs_svd.best_params['mae'])

Best value for SVD -RMSE: 0.8228 ; MAE: 0.63
Optimal params RMSE = {'n_epochs': 50, 'lr_all': 0.01, 'reg_all': 0.1}
optimal params MAE = {'n_epochs': 50, 'lr_all': 0.01, 'reg_all': 0.1}
```

Final SVD Model:

Final RMSE is a respectable 0.82, which we can look at as the average predicted rating being .82 stars away from the actual rating. ***

Some Information On the Metrics...

RMSE

The root mean squared error (RMSE) is a measure of the accuracy of a prediction model.

In a recommendation system, the RMSE score is calculated by taking the square root of the mean squared error between the predicted ratings and the actual ratings in the test set. The mean squared error is calculated by taking the sum of the squared differences between the predicted and actual ratings, and dividing by the number of ratings in the test set.

A lower RMSE score indicates that the model is making more accurate predictions, while a higher RMSE score indicates that the model is making less accurate predictions.

MAE

In a recommendation system, the MAE is calculated by taking the absolute value of the difference between the predicted ratings and the actual ratings in the test set, and averaging these differences over the number of ratings in the test set.

Like the root mean squared error (RMSE), the MAE is a measure of the average error of the model's predictions. However, unlike the RMSE, the MAE does not square the errors before averaging them, which means that it is less sensitive to large errors and may be more appropriate for data with a large number of outliers. And again, the lower the score the better.

KNN

In addition to using SVD, we will also run and compare some KNN algo's. In a recommendation system, KNN works by finding the K nearest neighbors of a user or item, and using these neighbors to make recommendations.

```
cv_knn_basic = cross_validate(KNNBasic(), data, cv=5, n_jobs=5,
verbose=True)
cv_knn_means = cross_validate(KNNWithMeans(), data, cv=5, n_jobs=5,
verbose=True)
cv_knn_z = cross_validate(KNNWithZScore(), data, cv=5, n_jobs=5,
verbose=True)
cv_knn_baseline = cross_validate(KNNBaseline(), data, cv=5, n_jobs=5,
verbose=True)
```

Evaluating RMSE, MAE of algorithm KNNBasic on 5 split(s).

	Fold 1	Fold 2	Fold 3	Fold 4	Fold 5	Mean	Std

KNN Grid Search

After running four different KNN algos, with 5 iterations each we see some baseline scores that look decent. Now just as we ran a grid search with our SVD model to find the optimal parameters, we will do the same with the KNN Baseline model which looked like it had the best results of the four KNN's that we ran.

#k-Nearest Neighbor Grid Search

Run time approx 10-15 min

#Collaborative filtering algorithm that uses Baseline rating

```

param_grid = {'k': [10, 20, 30, 40, 50, 60, 70, 80, 90, 100],
              'sim_options': {'user_based': [True, False]},\
              'bsl_options': {'method': ['als', 'sgd']}}

```

```

gs_knnb = GridSearchCV(KNNBaseline,
                        param_grid,
                        measures=['rmse', 'mae'],
                        cv=5)

```

```
gs_knnb.fit(data)
```

```

print(gs_knnb.best_score['rmse'])
print(gs_knnb.best_params['rmse'])

```

```

Visualizing our Scores:

We ran some initial iterations on our 2 algos and followed those up with a grid search, we will see if we can visualize all these scores to get a better sense of them.

The steps to do this will be as follows:

- Create a dataframe for the scores of both the KNN and SVD algorithm
- Merge those 2 dataframes
- Plot a bar chart to show comparison

```

score_visuals= pd.DataFrame(gs_knnb.best_score, index = param_grid)
score_visuals

```

```

          rmse      mae
k          0.836913  0.639995
sim_options 0.836913  0.639995
bsl_options 0.836913  0.639995

```

```

svd_score = pd.DataFrame(gs_svd.best_score, index = param_grid)
svd_score

```

```

          rmse      mae
k          0.822801  0.629953
sim_options 0.822801  0.629953
bsl_options 0.822801  0.629953

```

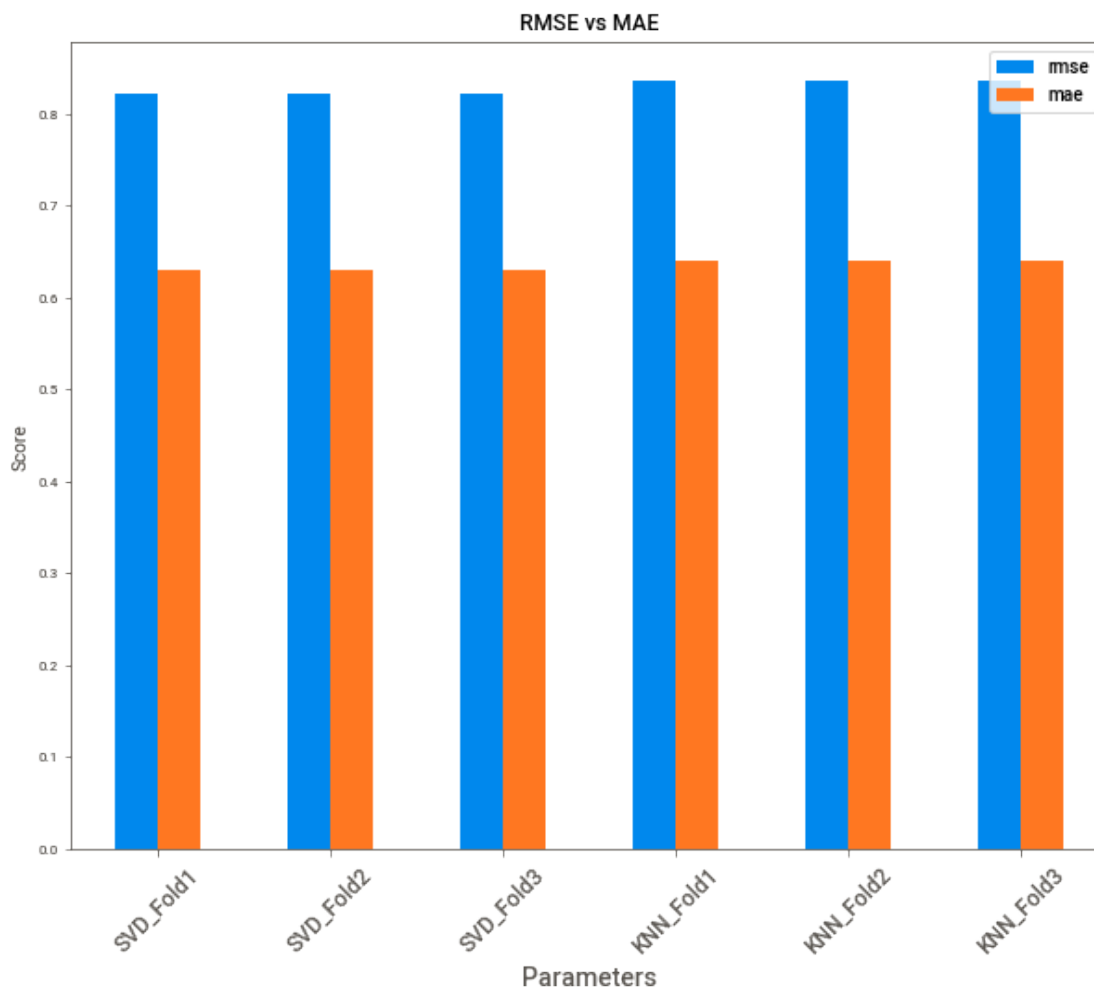

```

visual_df = pd.concat([svd_score, score_visuals], axis=0)
visual_df.index =
['SVD_Fold1', 'SVD_Fold2', 'SVD_Fold3', 'KNN_Fold1', 'KNN_Fold2', 'KNN_Fold
3']
visual_df

```

	rmse	mae
SVD_Fold1	0.822801	0.629953
SVD_Fold2	0.822801	0.629953
SVD_Fold3	0.822801	0.629953
KNN_Fold1	0.836913	0.639995
KNN_Fold2	0.836913	0.639995
KNN_Fold3	0.836913	0.639995

```
visual_df.plot(kind='bar', figsize=(10,8))
plt.title('RMSE vs MAE')
plt.xlabel('Parameters', fontsize =(14))
plt.xticks(rotation = 45, fontsize = (12))
plt.ylabel('Score')
plt.savefig('scores.png')
```

```
print('GridSearch Results:')
print('Algoritm\t RMSE\t\t MAE')
print()
print('KNN Baseline', '\t', round(gs_knnb.best_score['rmse'].mean(),
4), '\t', round(gs_knnb.best_score['mae'].mean(), 4))
```

```
print('SVD', '\t\t', round(gs_svd.best_score['rmse'].mean(), 4), '\t',
      round(gs_svd.best_score['mae'].mean(), 4))
```

GridSearch Results:

Algorithm	RMSE	MAE
KNN Baseline	0.8369	0.64
SVD	0.8228	0.63

Visual Results:

We see that the differences created by the GridSearch are so miniscule they are hardly noticeable between the the 2 algorithms. Therefore we will use the '.best_score' attribute to fit into our models and create 2 recommendation functions, one for each algorithm and compare the results.

Predictions

Now that we have our final KNN and SVD algorithms in place we will use the .fit attribute and then plug them into the 'get_top_n' function provided in the Surprise library documentation. This will return the top 5 items with the highest rating prediction for each user. We will try this on both our algorithms, starting with KNN.

```
final_knn_model = KNNBaseline(k=90, sim_options={'name':
'pearson_baseline', 'user_based': False},
                               bsl_options={'method': 'sgd'})
final_knn_model.fit(dataset)
```

```
Estimating biases using sgd...
Computing the pearson_baseline similarity matrix...
Done computing similarity matrix.
```

```
<surprise.prediction_algorithms.knns.KNNBaseline at 0x7ff8e8dd9a00>
```

```
predictions_k = final_knn_model.test(testset)
```

KNN Recommendation System:

```
from collections import defaultdict
```

```
def get_top_n_k(predictions_k, minimum_num_ratings= 50, n=5):
    """Return the top-N recommendation for each user from a set of
    predictions.
```

Args:

predictions(list of Prediction objects): The list of predictions, as

returned by the test method of an algorithm.

n(int): The number of recommendation to output for each user.

Default

is 10.

Returns:

A dict where keys are user (raw) ids and values are lists of tuples:

[(raw item id, rating estimation), ...] of size n.

Map the predictions to each user

top_n_k = defaultdict(list)

KNN Recommendation System Results:

So the function ran and created a list of users and estimated ratings like we hoped. To make a bit more sense of it in the cell above I retrieved the recommendations of a specific user. Those results looked very appropriate!

SVD Model

Just like with the KNN model we are going to fit our chosen SVD parameters to the dataset to allow us to make predictions in our function

```
# From our grid search:
```

```
#Best value for SVD -RMSE: 0.8511 ; MAE: 0.652
```

```

#Optimal params RMSE = {'n_epochs': 50, 'lr_all': 0.01, 'reg_all':
0.1}
#optimal params MAE = {'n_epochs': 50, 'lr_all': 0.01, 'reg_all': 0.1}

svd_algo = SVD(n_epochs=50, lr_all=0.01, reg_all=0.1)
svd_algo.fit(dataset)
svd_predictions = svd_algo.test(testset)

```

SVD Recommendation Function

The same function with SVD algo.

```

from collections import defaultdict

def get_top_n(svd_predictions, minimum_num_ratings= 50, n=5):
    """Return the top-N recommendation for each user from a set of
    predictions.

    Args:
        predictions(list of Prediction objects): The list of
        predictions, as
        returned by the test method of an algorithm.
        n(int): The number of recommendation to output for each user.
    Default
        is 10.

    Returns:
        A dict where keys are user (raw) ids and values are lists of
        tuples:
        [(raw item id, rating estimation), ...] of size n.
    """

```

SVD Results:

So after running the function, I used the three previous cells to get the top 5 recommendations for a specific user. The results seems ok, most of the movies are of similar rating but the genres are more spread out.

Cold Start Problem

While the prediction and functions are producing some good results, there is one issue it does not address. It is something known as the 'cold-start' problem, where our model can not predict movies for a new user since it has not gathered any data from that person yet.

```
def get_recommendations_for_new_user(new_user, movie_user_matrix,
svd_algo, N=5):
```

```
    """Return recommendations for a new user using a collaborative
filtering recommendation method.
```

```
    Args:
```

```
        new_user (pandas Series): The new user's ratings for a subset
of movies.
```

```
        movie_user_matrix (pandas DataFrame): The movie-user matrix
containing the ratings of all users.
```

```
        svd_algo
(surprise.prediction_algorithms.matrix_factorization.SVD): The trained
SVD algorithm.
```

```
        N (int): The number of recommendations to return.
```

```
    Returns:
```

```
        list: A list of tuples containing the recommended movie titles
and predicted ratings.
```

```

"""
# Create a temporary dataset
temp_df = pd.concat([movie_user_matrix, new_user], axis=0)
temp_df.fillna(0, inplace=True)
temp_matrix = temp_df.values

# Create a trainset from the temporary matrix
trainset_temp = data.build_full_trainset()

# Train the SVD algorithm on the temporary trainset
svd_algo.fit(trainset_temp)

# Get the predicted ratings for the new user
new_user_predictions =
svd_algo.test(trainset_temp.build_anti_testset())

# Sort the predictions by predicted rating in descending order
new_user_predictions.sort(key=lambda x: x.est, reverse=True)

# Return the top N movie titles and predicted ratings
return [(prediction.iid, prediction.est) for prediction in
new_user_predictions[:N]]

# Creating a new user with a few movie and ratings to add in...

new_user_ratings = pd.Series({'Toy Story (1995)': 5, 'Jumanji (1995)':
4, 'Grumpier Old Men (1995)': 2})
recommendations = get_recommendations_for_new_user(new_user_ratings,
movie_user_matrix, svd_algo, N=5)

# Seeing the recommendations for our new user...

for recommendation in recommendations:
    movie_title, prediction = recommendation
    print(f'Movie: {movie_title}, Predicted Rating: {prediction:.1f}')

Movie: Secrets & Lies (1996), Predicted Rating: 5.0
Movie: Guess Who's Coming to Dinner (1967), Predicted Rating: 5.0
Movie: Paths of Glory (1957), Predicted Rating: 5.0
Movie: Celebration, The (Festen) (1998), Predicted Rating: 5.0
Movie: Ran (1985), Predicted Rating: 5.0

```

Conclusion:

We began by inspecting and cleaning the data and then proceeded to train our algorithms. We got some very good results, especially with our KNN based model. Our 'cold-start' model is a work in progress but very promising.

Final Evaluation For our Stakeholder:

- Use the KNN model to launch

- Continue to test and re-run the models every few months
- Continue to use the Cold-Start engine to gain better insight into recommendation for the customers
- Consider weighting movies based on genre or year released, several of these movies being returned are classics, but quite old
